
Conversation Guide for Patients

Taking the First Steps

If you are 40 years or older, it is probably time to begin testing for cancer. Many cancers progress at varying rates and testing should be performed based on the guidance of a medical provider.

The IvyGene test is a highly accurate test that confirms the presence of cancer, as early as stage 1, and gives important information about your health, at the time of testing... Not simply a likelihood or propensity to have cancer, but actual information about your health when you test.

Print this Conversation Guide and bring it with you to your doctor's appointment.

Include all medical history and important health information when asking your doctor if the IvyGene test is right for you.

Is the IvyGene[™] test right for me?

Are you concerned about Cancer?

Yes No

Do you have a family history of cancer?

Yes No

Am I at risk for cancer?

Yes No

Ask: What options are available for cancer testing?

Ask: What risk factors do I have for cancer?

Ask: When should I begin testing?

The IvyGene[™] platform provides:

- Early Confirmation
- Measurable Information
- Tissue Specific Tests Available

****Medical Providers****

Medical Provider Information		*Required Information	
Provider Shipping Information		Order Verification	
Provide First Name *		I agree that I am a nationally recognized provider, with a certified NPI number who is willingly ordering this test for patients. I understand that the IvyGene™ test is a confirmatory test that is intended to be used by the ordering physician in conjunction with the patient's complete medical history and the results of standard of care testing. A large-scale clinical trial to demonstrate the efficacy of IvyGene™ as a cancer screening test has not been completed. The IvyGene™ Test has been investigated for (4) cancer types. These cancer types include: breast, colon, liver and lung. The presence of other cancers may result in an elevated IvyGene™ Score. Cancer screening is not an approved utility of the IvyGene™ test.
